

Technical Requirement Document

Here is the Technical Requirement Document (TRD) based on the provided Functional Requirement Document (FRD):

Technical Requirement ID: TR-E2E-001

Related Functional Requirement(s): FR-E2E-001, FR-E2E-002

Objective: Implement an Informatica mapping to read address change candidate records from Oracle staging source, perform data enrichment and transformations, and generate a flat-file style target dataset while updating staging control/audit attributes.

Target Cluster Configuration:

Cluster Name: Informatica PowerCenter

Databricks Runtime Version: Not applicable

Node Type: Informatica PowerCenter Server

Driver Node: Informatica PowerCenter Server

Worker Nodes: Not applicable

Autoscaling: Not applicable

Auto Termination: Not applicable

Libraries Installed: Informatica PowerCenter, Oracle Client

Source Data Details:

Dataset Name: `STG\_E2E\_AC\_TXDBH\_DATA`

Location: Oracle staging source

Format: Relational table

Description: Address change candidate records

Target Data Details:

Output Name: `DPAddressChangeYUYU`

Location: Flat file

Format: Text file

Description: Address change data extract

Job Flow / Pipeline Stages:

Read Source Data: Read address change candidate records from
`STG\_E2E\_AC\_TXDBH\_DATA`

Pre-Processing: Pass through key and address/phone fields, expose "PPAY_" fields

Enrichment: Perform lookups on `T\_YUYU\_CLNT` and `T\_YUYUK\_CLN` to retrieve owner name components

Business Transformations: Derive formatted dates, normalized postal code, address fallback logic, phone formatting, and owner name concatenation

Generate DP Address Change YUYU Extract: Generate flat-file style target dataset
`DPAddressChangeYUYU`

Update Staging Control/Audit Attributes: Update `STG\_E2E\_AC\_TXDBH\_DATA` with process stamps

Data Transformations / Business Logic:

Step: Derive process stamps

Description: Derive process date using `SYSDATE` and process user using
`\$\$M\_PROCESS\_USERID`

Transformation Logic: Use `SYSDATE` and `\$\$M\_PROCESS\_USERID` to derive process stamps

Step: Perform lookups on `T\_YUYU\_CLNT` and `T\_YUYUK\_CLN`

Description: Retrieve owner name components using `POL_NO =
T_TX_BASIC_POLICY_ID`

Transformation Logic: Use `POL\_NO = T\_TX\_BASIC\_POLICY\_ID` to perform lookups

Error Handling and Logging:

- Use Informatica PowerCenter's built-in error handling and logging mechanisms to capture and log errors during data processing.
- Log errors and warnings to a log file for further analysis and debugging.
