

Technical Requirement Document

Here is the Technical Requirement Document (TRD) based on the provided Functional Requirement Document (FRD):

Technical Requirement ID: TR-E2E-001

Related Functional Requirement(s): FR-E2E-001

Objective: Implement a data integration job to extract data from Microsoft SQL Server source tables, transform it using a predefined mapping, and load it into an Oracle database target table.

Target Cluster Configuration:

Cluster Name: Informatica PowerCenter Cluster

Databricks Runtime Version: Not Applicable (Informatica PowerCenter is used)

Node Type: Informatica PowerCenter Node

Driver Node: Informatica PowerCenter Server

Worker Nodes: Informatica PowerCenter Worker Nodes

Autoscaling: Not Applicable

Auto Termination: Not Applicable

Libraries Installed: Informatica PowerCenter Libraries, Microsoft SQL Server JDBC Driver, Oracle JDBC Driver

Source Data Details:

Dataset Name: T_TX_REQUEST_POLICY, T_TX_BASIC, T_TX_RELATION, T_TX_REQUEST, T_TX_DTL_BENEFICIARY_CHANGE

Location (Path/Table): Microsoft SQL Server Database Tables

Format: Relational Database Tables

Description: Source tables containing policy services data

Target Data Details:

Output Name: STG_E2E_BC_K2H_TXDB_DATA

Location: Oracle Database

Format: Relational Database Table

Description: Target table for loaded data

Job Flow / Pipeline Stages:

- Source Data Extraction
- Data Transformation using mapping (m_E2E_BC_K2H_DATA_EXTRACTION)
- Target Data Loading

Data Transformations / Business Logic:

Step: Extract data from source tables

Description: Retrieve specified fields from each source table

Transformation Logic: Use Informatica PowerCenter to extract data from source tables

Step: Transform data using mapping (m_E2E_BC_K2H_DATA_EXTRACTION)

Description: Apply various transformations (e.g., SQ_, JTX, EXP) to process extracted data

Transformation Logic: Use Informatica PowerCenter to apply transformations as defined in the mapping

Error Handling and Logging:

- The mapping (m_E2E_BC_K2H_DATA_EXTRACTION) should be designed to handle errors and exceptions properly.
- The system should log and track any errors or issues that occur during data extraction, transformation, and loading.
