

Functional Requirement Document

Based on the provided Business Requirement Document (BRD), I have extracted the "Coding Requirements" section and created a detailed Functional Requirement Document (FRD) in bullet points. Here is the FRD:

FR-DPACY-001: Execute Workflow

wf_E2E_AC_TXDBH_DP_YUYU_CREATION

Title: Execute DPAddressChangeYUYU Workflow

Description: The system must execute the wf_E2E_AC_TXDBH_DP_YUYU_CREATION workflow on demand, triggered by an upstream control.

Preconditions:

- Upstream control trigger is received.

Main Flow / Functional Steps:

1. Start workflow.
2. Execute s_SRC_REC_CNT_CHK session to count incoming records.
3. Evaluate TgtSuccessRows:
 - If TgtSuccessRows = 0, proceed to CMD_TRIGGER_FILE_CREATION.
 - If TgtSuccessRows ≥ 1, proceed to s_YUYU_CREATION session.
4. Execute CMD_TRIGGER_FILE_CREATION or s_YUYU_CREATION based on the previous step's outcome.
5. Execute CMD_TRIGGER_DEL after s_YUYU_CREATION.

FR-DPACY-002: Count Incoming Records in s_SRC_REC_CNT_CHK Session

Title: Count Incoming Records

Description: The system must count the incoming records in the s_SRC_REC_CNT_CHK session using the m_E2E_AC_TXDBH_DP_YUYU_SRC_REC_CNT_CHK mapping.

Preconditions:

- STG_E2E_AC_TXDBH_DATA is available.

Main Flow / Functional Steps:

1. Read data from STG_E2E_AC_TXDBH_DATA using Source Qualifier.
2. Count incoming records using Aggregator.

FR-DPACY-003: Create DPAddressChangeYUYU File in s_YUYU_CREATION Session

Title: Create DPAddressChangeYUYU File

Description: The system must create the DPAddressChangeYUYU file using the m_E2E_AC_TXDBH_DP_YUYU_CREATION mapping.

Preconditions:

- Incoming records exist (TgtSuccessRows ≥1).

Main Flow / Functional Steps:

1. Read data from STG_E2E_AC_TXDBH_DATA using Source Qualifier with SQL override for transliteration.
2. Perform lookups using LKP_YUYU_CLNT and LKP_YUYUK_CLN.
3. Apply transformations using EXP_ADD_CHNG and EXP_YUYU_CHNG.
4. Generate SEQUENCE_NUMBER using SEQTRANS.
5. Write data to DPAddressChangeYUYU flat file and STG_E2E_AC_TXDBH_DATA_TGT table.

FR-DPACY-004: Write to DPAddressChangeYUYU Flat File

Title: Write to DPAddressChangeYUYU Flat File

Description: The system must write the transformed data to the DPAddressChangeYUYU flat file.

Preconditions:

- Data is transformed and ready for output.

Main Flow / Functional Steps:

1. Write data to DPAddressChangeYUYU file with specified format and naming convention.
2. Commit every 10,000 rows.

FR-DPACY-005: Update Workflow Variables

Title: Update Workflow Variables

Description: The system must update workflow variables after session success.

Preconditions:

- Session is successful.

Main Flow / Functional Steps:

1. Update \$\$WF_FILE_TMSTMP with \$\$M_FILE_TMSTMP.

2. Update \$\$wf_SOURCE_COUNT with \$\$M_REC_COUNT.

FR-DPACY-006: Handle Errors and Exceptions

Title: Handle Errors and Exceptions

Description: The system must handle errors and exceptions during workflow execution.

Preconditions:

- Errors occur during workflow execution.

Main Flow / Functional Steps:

1. Command tasks fail only their scope, and workflow continues.
2. Session errors do not trigger rollback; Commit On EOF = YES.
3. Lookup failures produce null outputs for associated fields, and processing continues.
