

Code Explanation

Configuration Parameters for Data Pipeline

The provided code is a Python configuration file that defines various parameters for a data pipeline. It includes source data paths, target catalog and schema, table names, and schema definitions for different tables.

Overview of the Code

This configuration file is used to store constants and parameters that are used throughout the data pipeline. It provides a centralized location for managing configuration settings, making it easier to modify or update the pipeline.

Step 1: Defining Source Data Paths

This step defines the paths to the source data files. The data pipeline will read data from these locations.

```
# Source data paths
CUSTOMER_DATA_PATH = "/Volumes/gen_ai_poc_databrickscoe/sdlc_wizard/customerdata"
ORDER_DATA_PATH = "/Volumes/gen_ai_poc_databrickscoe/sdlc_wizard/orderdata"
```

Step 2: Specifying Target Catalog and Schema

This step specifies the target catalog and schema where the processed data will be written.

```
# Target catalog and schema
TARGET_CATALOG = "gen_ai_poc_databrickscoe"
TARGET_SCHEMA = "sdlc_wizard"
```

Step 3: Defining Table Names

This step defines the names of the tables that will be used in the data pipeline.

```
# Table names
CUSTOMER_TABLE = "customer"
ORDER_TABLE = "order"
ORDER_SUMMARY_TABLE = "ordersummary"
CUSTOMER_AGGREGATE_SPEND_TABLE = "customeraggregate spend"
```

Step 4: Defining Schema Definitions

This step defines the schema for each of the tables used in the data pipeline. The schema definitions include the column names for each table.

```
# Schema definitions
CUSTOMER_SCHEMA = ["CustId", "Name", "EmailId", "Region"]
ORDER_SCHEMA = ["OrderId", "ItemName", "PricePerUnit", "Qty", "Date", "CustId"]
```

```
ORDER_SUMMARY_SCHEMA = ["CustId", "Name", "EmailId", "Region", "OrderId", "ItemName", "PricePerUnit", "Qty", "Date", "TotalAmount", "IsActive", "StartDate", "EndDate"]  
CUSTOMER_AGGREGATE_SCHEMA = ["Name", "TotalAmount", "Date"]
```
