

Functional Requirement Document

Here are the detailed Functional Requirements based on the provided BRD's "Coding Requirements" section:

FR-E2E-001: Read Address Change Candidate Records

Title: Read address change candidate records from Oracle staging source

Description: The system must read address change candidate records from the Oracle staging source table `STG\_E2E\_AC\_TXDBH\_DATA`.

Preconditions: The Oracle staging source table `STG\_E2E\_AC\_TXDBH\_DATA` is available and contains the required data.

Main Flow / Functional Steps:

- Read data from `STG\_E2E\_AC\_TXDBH\_DATA` table.
- Pass the data to the next transformation for processing.

FR-E2E-002: Create Flat File Output

Title: Create flat file output for DP Address Change YUYU

Description: The system must create a flat file output containing the required fields for DP Address Change YUYU.

Preconditions: The input data is available from the previous transformation.

Main Flow / Functional Steps:

- Generate a sequence number using `SEQTRANS.NEXTVAL`.
- Derive the required fields (e.g., `ORIGIN\_REQUEST\_ID`, `POLICY\_ID`, `RECEPTION\_DATE`, etc.) based on the input data and business rules.
- Create a flat file output with the required fields.

FR-E2E-003: Update Staging Table

Title: Update staging table with process metadata and key identifiers

Description: The system must update the staging table `STG\_E2E\_AC\_TXDBH\_DATA` with process metadata and key identifiers.

Preconditions: The input data is available from the previous transformation.

Main Flow / Functional Steps:

- Update the `STG\_E2E\_AC\_TXDBH\_DATA` table with the required fields (e.g., `STG\_PROCESS\_DATE`, `STG\_PROCESS\_USERID`, etc.) based on the input data and business rules.
- Use the `DD\_UPDATE` update strategy to update the table.

FR-E2E-004: Derive Reception Date

Title: Derive reception date in the required format

Description: The system must derive the reception date in the required format based on the input data.

Preconditions: The input data contains the `T\_TX\_REQUEST\_REQ\_ACC\_DATETIME` field.

Main Flow / Functional Steps:

- Convert the `T\_TX\_REQUEST\_REQ\_ACC\_DATETIME` field to the required format using the specified business rule (BR-03).

FR-E2E-005: Apply Address Fallback Logic

Title: Apply address fallback logic when ZIP is missing

Description: The system must apply address fallback logic when the ZIP code is missing.

Preconditions: The input data contains the required fields (e.g., `T\_TX\_DTL\_ADD\_CH\_N\_TRANS\_ZIP`, `PPAY\_ADR1\_FW`, etc.).

Main Flow / Functional Steps:

- Check if the ZIP code is missing.
- Apply the fallback logic to derive the required address fields (e.g., `NEW\_ADDRESS\_KANA\_1`, `NEW\_ADDRESS\_KANA\_2`, etc.) based on the specified business rule (BR-04).

FR-E2E-006: Normalize Postal Code

Title: Normalize postal code by removing hyphens

Description: The system must normalize the postal code by removing hyphens.

Preconditions: The input data contains the `T\_TX\_DTL\_ADD\_CH\_N\_TRANS\_ZIP` field.

Main Flow / Functional Steps:

- Remove hyphens from the postal code using the specified business rule (BR-05).

FR-E2E-007: Format Telephone Number

Title: Format telephone number according to the specified rules

Description: The system must format the telephone number according to the specified rules.

Preconditions: The input data contains the `T\_TX\_DTL\_ADD\_CH\_N\_TRANS\_PHNO` field.

Main Flow / Functional Steps:

- Format the telephone number using the specified business rule (BR-06).

FR-E2E-008: Derive Policy Owner Name

Title: Derive policy owner name in Kana and Kanji

Description: The system must derive the policy owner name in Kana and Kanji based on the input data and lookup tables.

Preconditions: The input data contains the required fields (e.g., `T\_TX\_BASIC\_POLICY\_ID`, etc.) and the lookup tables are available.

Main Flow / Functional Steps:

- Perform lookups on the `T\_YUYU\_CLNT` and `T\_YUYUK\_CLN` tables to retrieve the required data.
- Derive the policy owner name in Kana and Kanji using the specified business rules (BR-07 and BR-08).

FR-E2E-009: Stamp Process Metadata

Title: Stamp process metadata on staging update

Description: The system must stamp process metadata (e.g., `STG\_PROCESS\_DATE`, `STG\_PROCESS\_USERID`, etc.) on the staging update.

Preconditions: The input data is available from the previous transformation.

Main Flow / Functional Steps:

- Derive the process metadata using the specified business rules (BR-01 and BR-02).
- Update the staging table with the process metadata.
