

Functional Requirement Document

Here are the detailed functional requirements based on the provided BRD:

FR-WF-001: Execute Workflow wf_E2E_AC_TXDBH_DP_YUYU_CREATION

Title

Execute Workflow wf_E2E_AC_TXDBH_DP_YUYU_CREATION for DP Address Change (YUYU) Outbound File Creation and Staging Update

Description

The system executes the workflow wf_E2E_AC_TXDBH_DP_YUYU_CREATION to generate the DP Address Change (YUYU) outbound file and update the Oracle staging table with processing status and audit fields.

Preconditions

- The workflow is enabled.
- The source Oracle staging table (STG_E2E_AC_TXDBH_DATA) contains data.
- The lookup tables (T_YUYU_CLNT and T_YUYUK_CLN) in Oracle ODS are available.

Main Flow / Functional Steps

1. Source Record Count Check

- Execute session `s\_E2E\_AC\_TXDBH\_DP\_YUYU\_SRC\_REC\_CNT\_CHK` to count source records.
- Write the count to a flat file `FF\_Source\_Count`.

2. Conditional Logic Based on Source Record Count

- If the count is 0, execute `CMD\_TRIGGER\_FILE\_CREATION`.
- If the count is greater than or equal to 1, proceed to the next step.

3. Generate Outbound File and Update Staging

- Execute session `s\_E2E\_AC\_TXDBH\_DP\_YUYU\_CREATION` to generate the outbound DP Address Change (YUYU) file.
- Update the Oracle staging table (STG_E2E_AC_TXDBH_DATA_TGT) with processing status and audit fields.

4. Post-Success Actions

- If `s\_E2E\_AC\_TXDBH\_DP\_YUYU\_CREATION` succeeds, execute `CMD\_TRIGGER\_DEL`.

Detailed Steps for Session `s\_E2E\_AC\_TXDBH\_DP\_YUYU\_SRC\_REC\_CNT\_CHK`

- Read from `STG\_E2E\_AC\_TXDBH\_DATA` using a SQL query defined by `\$\$M\_SRC\_SQL`.
- Aggregate the count using an Aggregator transformation.
- Write the count to `FF\_Source\_Count`.

Detailed Steps for Session `s\_E2E\_AC\_TXDBH\_DP\_YUYU\_CREATION`

1. Source Extraction

- Use `SQ\_STG\_E2E\_AC\_TXDBH\_DATA` with an override SQL query that includes transformed PPAY address fields.

2. Transformations

- `EXP\_ADD\_CHNG`: Pass through extracted columns.
- `LKP\_YUYU\_CLNT` and `LKP\_YUYUK\_CLN`: Lookup policy owner names.
- `EXP\_YUYU\_CHNG`: Perform formatting and fallback logic for output fields and derive audit fields.
- `SEQTRANS`: Generate a sequence number for the outbound file.

3. Target Operations

- Write to the outbound flat file `DPAAddressChangeYUYU`.
- Update the Oracle staging table `STG\_E2E\_AC\_TXDBH\_DATA\_TGT` using `UPDTRANS\_YUYU\_STG\_UPD`.

Detailed Steps for `CMD\_TRIGGER\_FILE\_CREATION`

1. Create/empty the trigger file `DPACYUYU\_TriggerFile.txt`.
2. Execute a shell script `E2E\_AC\_DelFile\_DPAAddressChangeYUYU.sh` for file cleanup.

Detailed Steps for `CMD\_TRIGGER\_DEL`

1. Set the trigger indicator in `DPACYUYU\_TriggerFile.txt`.
2. Execute the same shell script `E2E\_AC\_DelFile\_DPAAddressChangeYUYU.sh` for cleanup.

FR-WF-002: Source Record Count Check Logic

Title

Implement	Source	Record	Count	Check	Logic	in
`s_E2E_AC_TXDBH_DP_YUYU_SRC_REC_CNT_CHK`						

Description

The session `s\_E2E\_AC\_TXDBH\_DP\_YUYU\_SRC\_REC\_CNT\_CHK` counts the source records in `STG\_E2E\_AC\_TXDBH\_DATA` and writes the count to a flat file.

Preconditions

- `STG\_E2E\_AC\_TXDBH\_DATA` is accessible.
- `\$\$M\_SRC\_SQL` is defined.

Main Flow / Functional Steps

1. Read from `STG\_E2E\_AC\_TXDBH\_DATA` using `\$\$M\_SRC\_SQL`.
2. Aggregate the count.
3. Write the count to `FF\_Source\_Count`.

FR-WF-003: Outbound File Generation Logic

Title

Implement Outbound DP Address Change (YUYU) File Generation Logic in `s\_E2E\_AC\_TXDBH\_DP\_YUYU\_CREATION`

Description

The session generates the outbound DP Address Change (YUYU) file based on data from `STG\_E2E\_AC\_TXDBH\_DATA` and lookup data.

Preconditions

- Source data is available in `STG\_E2E\_AC\_TXDBH\_DATA`.
- Lookup tables are accessible.

Main Flow / Functional Steps

1. Extract data from `STG\_E2E\_AC\_TXDBH\_DATA`.
2. Perform lookups for policy owner names.
3. Apply transformation logic for output fields.
4. Generate the outbound file.

FR-WF-004: Staging Table Update Logic

Title

Implement Staging Table Update Logic in `s\_E2E\_AC\_TXDBH\_DP\_YUYU\_CREATION`

Description

Update the Oracle staging table `STG\_E2E\_AC\_TXDBH\_DATA\_TGT` with processing status and audit fields.

Preconditions

- Data is processed and available for update.

Main Flow / Functional Steps

1. Derive the update values for `STG\_TXDB\_STATUS`, `STG\_PROCESS\_DATE`, and `STG\_PROCESS\_USERID`.
2. Update `STG\_E2E\_AC\_TXDBH\_DATA\_TGT` using `UPDTRANS\_YUYU\_STG\_UPD`.
