

Technical Requirement Document

Here is the Technical Requirement Document (TRD) based on the provided Functional Requirement Document (FRD):

TR-WF-001: Execute Workflow

wf_E2E_AC_TXDBH_DP_YUYU_CREATION

Related Functional Requirement(s): FR-WF-001, FR-WF-002, FR-WF-003, FR-WF-004

Objective: Implement an Informatica PowerCenter workflow to generate the DP Address Change (YUYU) outbound file and update the Oracle staging table with processing status and audit fields.

Target Cluster Configuration:

- Cluster Name: Informatica PowerCenter Cluster
- Informatica PowerCenter Version:
- Node Type: Informatica Node
- Integration Service: Informatica Integration Service
- Repository: Informatica Repository
- Libraries Installed: Informatica PowerCenter Libraries

Source Data Details:

- Dataset Name: STG_E2E_AC_TXDBH_DATA
- Location: Oracle Staging Table
- Format: Relational
- Description: Source data for DP Address Change (YUYU) outbound file generation
- Dataset Name: T_YUYU_CLNT and T_YUYUK_CLN
- Location: Oracle ODS
- Format: Relational
- Description: Lookup tables for policy owner names

Target Data Details:

- Output Name: DPAddressChangeYUYU
- Location: Outbound Flat File
- Format: Flat File
- Description: DP Address Change (YUYU) outbound file

- Output Name: STG_E2E_AC_TXDBH_DATA_TGT
- Location: Oracle Staging Table
- Format: Relational
- Description: Updated Oracle staging table with processing status and audit fields
- Output Name: FF_Source_Count
- Location: Flat File
- Format: Flat File
- Description: Source record count

Job Flow / Pipeline Stages:

- Source Record Count Check
- Conditional Logic Based on Source Record Count
- Generate Outbound File and Update Staging
- Post-Success Actions

Data Transformations / Business Logic:

- Step: Source Record Count Check
- Description: Count source records in STG_E2E_AC_TXDBH_DATA
- Transformation Logic: Use \$\$M_SRC_SQL to read from STG_E2E_AC_TXDBH_DATA and aggregate the count
- Step: Generate Outbound File
- Description: Generate DP Address Change (YUYU) outbound file
- Transformation Logic: Use SQ_STG_E2E_AC_TXDBH_DATA with override SQL query, EXP_ADD_CHNG, LKP_YUYU_CLNT, LKP_YUYUK_CLN, EXP_YUYU_CHNG, and SEQTRANS to generate the outbound file
- Step: Update Staging Table
- Description: Update Oracle staging table with processing status and audit fields
- Transformation Logic: Derive update values for STG_TXDB_STATUS, STG_PROCESS_DATE, and STG_PROCESS_USERID and update STG_E2E_AC_TXDBH_DATA_TGT using UPDTRANS_YUYU_STG_UPD

Error Handling and Logging:

- Use Informatica PowerCenter's built-in error handling and logging mechanisms to capture and log errors and exceptions.
- Implement logging to track workflow execution, session execution, and data processing.
- Use Informatica PowerCenter's notification features to send notifications on workflow failure or success.
